THE LATEST EVOLUTION IN SIGNATURES!

Carbon Copy Functionality

Completed documents are now easier to deliver. When sending, activate the "CC" checkbox for each participant to receive the documents. The user sending the documents automatically receives the documents once completed.
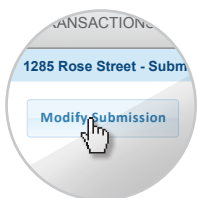

Group Signing Options

Signers can be grouped together to sign at the same time, with simple drag and drop functionality. Grouped participants, such as spouses, can then sign without waiting for the other to sign.

Add PDF Documents to be Signed

Any document in PDF format can be added to a transaction to be signed. Once uploaded the document is prepared by adding signature and initial tags before sending.

Interactive Document Display

When editing documents before sending on the Agent's side, they are completely scrollable for faster navigation. The entire form is displayed for quickly adding signatures, initials and custom fields.
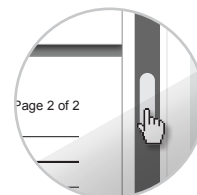

Post Send Control

Once documents are sent, users control the process. Within the embedded interface access options to suspend and modify or cancel signatures.

Simple Document Preparation

Refined and simplified to better serve the agent user. Drag and Drop signature, date, initial fields and more on to documents. Fields may be added anywhere on any form. Additional input fields include Checkbox and Textfield.

User-Friendly Interface with Step-by-Step Process

The embedded interface is designed specifically for users. Sending documents follows a simple step-by-step flow, guiding users through the sending process.

Add Custom Signers

Add new parties to the transaction that may not be listed within the form (ex. Seller 3, Seller 4). Collect required or optional information from signers other than signatures.
